# 5. Security Recommendations

**1.** Investigate repeated attack predictions from the same source address.

**2.** Monitor network flows with unusually high traffic volume or packet counts.

**3.** Review suspicious TCP and UDP connections identified by the ML classifier.

**4.** Use the attack confidence score together with network context when validating alerts.

**5.** Continue collecting representative network traffic to improve the IDS model.

**6.** Periodically retrain and evaluate the model using updated datasets.

# 6. Conclusion

The Real-Time Intrusion Detection System combines live network packet capture, flow-level feature extraction, machine-learning classification, threshold optimization, CSV logging and dashboard-based monitoring. The generated statistics and attack history provide a summary of the traffic observed during the monitoring period.
